

Available Instructional Input $A_{r,c}$

An accounting system can be understood as a three-stage information process. In the first stage of the accounting information process, the organization classifies, summarizes, and analyzes transaction data. In the second stage of the accounting information process, the organization turns the organized transaction data into financial reports.

Knowledge Encoding

Encoded Knowledge

An accounting system is a three-stage information process where the organization first classifies, summarizes, and analyzes transaction data, then converts that organized data into financial reports.
